

Blue Tomato

TM929-10 - OSU Blue Tomato

85 days. *Solanum lycopersicum*. Open Pollinated. The plant produces high yields of 3 to 4" blue tomatoes. This was the first blue pigment tomato. It is blue on the outside and pinkish-red flesh and has the same antioxidant that is found in blueberries! They are very sweet and are perfect for salads, sandwiches, snacks, gourmet dishes, and vegetable platters. An excellent choice for home gardens. A variety was developed at Oregon State University by cross-pollinating a regular red tomato with a blue wild tomato. Indeterminate.
